### **General Description**

The MAX333A is a precision, quad, single-pole doublethrow (SPDT) analog switch. The four independent switches operate with bipolar supplies ranging from  $\pm 4.5V$  to  $\pm 20V$ , or with a single-ended supply between  $\pm 10V$  and  $\pm 30V$ . The MAX333A offers low on resistance (less than  $35\Omega$ ), guaranteed to match within  $2\Omega$  between channels and to remain flat over the analog signal range ( $\Delta 3\Omega$  max). It also offers break-before-make switching (10ns typical), with turn-off times less than 145ns and turn-on times less than 175ns. The MAX333A is ideal for portable operation since quiescent current runs less than 50µA with all inputs high or low.

This monolithic, quad switch is fabricated with Maxim's new improved silicon-gate process. Design improvements guarantee extremely low charge injection (10pC), low power consumption (3.75mW), and electrostatic discharge (ESD) greater than 2000V.

Logic inputs are TTL and CMOS compatible and guaranteed over a +0.8V to +2.4V range—regardless of supply voltage. Logic inputs and switched analog signals can range anywhere between the supply voltages without damage.

#### Features

- Upgraded Replacement for a DG211/DG212 Pair or Two DG403s
- Low On Resistance < 17Ω Typical (35Ω Max)</li>
- ♦ Guaranteed Matched On Resistance Between Channels < 2Ω</li>
- Guaranteed Flat On Resistance over Analog Signal Range Δ3Ω Max
- Guaranteed Charge Injection < 10pC</p>
- ♦ Guaranteed Off-Channel Leakage < 6nA at +85°C
- ESD Guaranteed > 2000V per Method 3015.7
- Single-Supply Operation (+10V to +30V) Bipolar-Supply Operation (±4.5V to ±20V)
- TTL-/CMOS-Logic Compatibility
- ♦ Rail-to-Rail Analog Signal Handling Capability

### **Ordering Information**

PART	TEMP. RANGE	PIN-PACKAGE
MAX333ACPP	0°C to +70°C	20 Plastic DIP
MAX333ACWP	0°C to +70°C	20 Wide SO
MAX333ACUP	0°C to +70°C	20 TSSOP

#### **ABSOLUTE MAXIMUM RATINGS**

V+ to V	44V
VIN, VCOM, VNO, VNC	V- to V+
(V <sub>NO</sub> - V <sub>NC</sub> )	32V
V+ to Ground	
V- to Ground	30V
Current, Any Terminal Except V <sub>COM</sub> , V <sub>NO</sub> , or V <sub>NC</sub>	30mA
Continuous Current, VCOM, VNO, or VNC	20mA
Peak Current, VCOM, VNO, or VNC	
(Pulsed at 1ms, 10% duty cycle max)	70mA
ESD	2000V

Continuous Power Dissipation ( $T_A = +70^{\circ}C$ ) (Note 1)
Plastic DIP (derate above +70°C by 11.11mW/°C)889mW
SO (derate above +70°C by 10.00mW/°C)800mW
CERDIP (derate above +70°C by 11.11mW/°C)889mW
TSSOP (derate above +70°C by 7mW/°C)559mW
Operating Temperature Ranges:
MAX333AC0°C to +70°C
MAX333AE40°C to +85°C
MAX333AMJP
Storage Temperature Range65°C to +150°C
Lead Temperature (soldering, 10sec)+300°C

Note 1: Device mounted with all leads soldered to PC board.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

#### **ELECTRICAL CHARACTERISTICS—Dual Supplies**

5	V-	Negative Power Supply
6	GND	Ground
15	N.C.	Not Internally Connected
16	V+	Positive Power Supply

The main limitation of supply voltages other than  $\pm 15V$  is

a reduction in the analog signal range. The MAX333A operates with  $\pm 5V$  to  $\pm 20V$  bipolar supplies. The Typical Operating Characteristics and graphs show typical on resistance for  $\pm 15V$ ,  $\pm 10V$ ,  $\pm 5$  supplies. Switching times increase by a factor of two or more for ±5V operation. The MAX333A can operate from +10V to +24V unipolar supplies. It can be powered from a single +10V to +24V supply, as well as from unbalanced supplies such as +24V and -5V. Connect V- to 0V when

**Applications Information Operation with Supply Voltages** 

Other than ±15V<sub>o</sub>

#### **Pin Description**

Proper power-supply sequencing is recommended for all CMOS devices. It is important not to exceed the absolute maximum ratings because stresses beyond the listed ratings may cause permanent damage to the devices. Always sequence V+ on first, followed by VL, V-, and logic inputs. If power-supply sequencing is not possible, add two small signal diodes in series with the supply pins (Figure 1). Adding the diodes reduces the analog signal range to 1V below V+ and 1V below V-, but low switch resistance and low leakage characteristics are unaffected.
