

# MC78LC00 Series

## Micropower Voltage Regulator

The MC78LC00 series of fixed output low dropout linear regulators are designed for handheld communication equipment and portable battery powered applications which require low quiescent current. The MC78LC00 series features an ultra-low quiescent current of 1.1  $\mu\text{A}$ . Each device contains a voltage reference unit, an error amplifier, a PMOS power transistor, and resistors for setting output voltage.

The MC78LC00 has been designed to be used with low cost ceramic capacitors and requires a minimum output capacitor of 0.1  $\mu\text{F}$ . The device is housed in the micro-miniature Thin SOT23-5 surface mount package and SOT-89, 3 pin. Standard voltage versions are 1.5, 1.8, 2.5, 2.7, 2.8, 3.0, 3.3, 4.0, and 5.0 V. Other voltages are available in 100 mV steps.

### Features

- Low Quiescent Current of 1.1  $\mu\text{A}$  Typical
- Excellent Line and Load Regulation
- Maximum Operating Voltage of 12 V
- Low Output Voltage Option
- High Accuracy Output Voltage of 2.5%
- Industrial Temperature Range of  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$
- Two Surface Mount Packages (SOT-89, 3 Pin, or SOT-23, 5 Pin)

### Typical Applications

- Battery Powered Instruments
- Hand-Held Instruments
- Camcorders and Cameras

This device contains 8 active transistors.

11. Low duty pulse techniques are used during test to maintain junction temperature as close to ambient as possible.

12. Output Current is measured when  $V_{out} = V_{O1} - 3\%$  where  $V_{O1} = V_{out}$  at  $I_{out} = 0\text{ mA}$ .

# MC78LC00 Series

## DEFINITIONS

### Load Regulation

The change in output voltage for a change in output current at a constant temperature.

### Dropout Voltage

The input/output differential at which the regulator output no longer maintains regulation against further reductions in input voltage. Measured when the output drops 3% below its nominal. The junction temperature, load current, and minimum input supply requirements affect the dropout level.

### Maximum Power Dissipation

The maximum total dissipation for which the regulator will operate within its specifications.

### Quiescent Current

The quiescent current is the current which flows through the ground when the LDO operates without a load on its output: internal IC operation, bias, etc. When the LDO becomes loaded, this term is called the Ground current. It is

actually the difference between the input current (measured through the LDO input pin) and the output current.

### Line Regulation

The change in output voltage for a change in input voltage. The measurement is made under conditions of low dissipation or by using pulse technique such that the average chip temperature is not significantly affected.

### Line Transient Response

Typical over and undershoot response when input voltage is excited with a given slope.

### Maximum Package Power Dissipation

The maximum power package dissipation is the power dissipation level at which the junction temperature reaches its maximum operating value, i.e. 125°C. Depending on the ambient power dissipation and thus the maximum available output current.

## APPLICATIONS INFORMATION

A typical application circuit for the MC78LC00 series is shown in Figure 20.

### Input Decoupling (C1)

A 0.1  $\mu\text{F}$  capacitor either ceramic or tantalum is recommended and should be connected close to the MC78LC00 package. Higher values and lower ESR will improve the overall line transient response.

### Output Decoupling (C2)

The MC78LC00 is a stable component and does not require any specific Equivalent Series Resistance (ESR) or a minimum output current. Capacitors exhibiting ESRs ranging from a few  $\text{m}\Omega$  up to  $3.0\ \Omega$  can thus safely be used. The minimum decoupling value is 0.1  $\mu\text{F}$  and can be augmented to fulfill stringent load transient requirements. The regulator accepts ceramic chip capacitors as well as tantalum devices. Larger values improve noise rejection and load regulation transient response.

### Hints

Please be sure the  $V_{\text{in}}$  and Gnd lines are sufficiently wide. When the impedance of these lines is high, there is a chance to pick up noise or cause the regulator to malfunction.

Set external components, especially the output capacitor, as close as possible to the circuit, and make leads as short as possible.

### Thermal

As power across the MC78LC00 increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and also the ambient temperature effect the rate of temperature rise for the part. This is stating that when the MC78LC00 has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power dissipation applications.

The maximum dissipation the package can handle is given by:

$$PD = \frac{T_{J(\text{max})} - T_A}{R_{\theta JA}}$$

If junction temperature is not allowed above the maximum  $125^\circ\text{C}$ , then the MC78LC00NTR can dissipate up to 357 mW @  $25^\circ\text{C}$ .

The power dissipated by the MC78LC00NTR can be calculated from the following equation:

$$P_{\text{tot}} = [V_{\text{in}} * I_{\text{gnd}}] + [V_{\text{in}} - V_{\text{out}}] * I_{\text{out}}$$

or

$$V_{\text{inMAX}} = \frac{P_{\text{tot}} + V_{\text{out}} * I_{\text{out}}}{I_{\text{gnd}} + I_{\text{out}}}$$

If an 80 mA output current is needed then the ground current from the data sheet is 1.1  $\mu\text{A}$ . For an MC78LC30NTR (3.0 V), the maximum input voltage will then be 7.4 V.

Figure 20. Basic Application Circuit for NTR Suffixes

## MC78LC00 Series

Figure 21. Current Boost Circuit

Figure 22. Adjustable  $V_O$

Figure 23. Current Boost Circuit with Overcurrent Limit Circuit

$$V_O = V_{O(\text{Reg})} \left( 1 + \frac{R_2}{R_1} \right) + I_{CC} R_2$$

$$I_{O(\text{short circuit})} \approx \frac{V_{BE2}}{R_2} + \frac{V_{BE1} + V_{BE2}}{R_1}$$

# MC78LC00 Series

## MINIMUM RECOMMENDED FOOTPRINT FOR SURFACE MOUNTED APPLICATIONS

Surface mount board layout is a critical portion of the total design. The footprint for the semiconductor packages must be the correct size to insure proper solder connection

interface between the board and the package. With the correct pad geometry, the packages will self align when subjected to a solder reflow process.
